### 1.1 Purpose of report

This report provides, in a single volume, the annual results of the Inuvialuit Harvest Study (IHS) from 1988 to 1997, totals for the ten-year period, and the statement of the methods and administration of the survey. In view of lower reporting rates and different survey intervals for the start-up phase ( 1 July 1986 to 31 December 1987), no attempt was made to estimate total harvests for that period. Fabijan (1991) therefore remains as the authoritative record of the IHS for the start-up phase. The IHS Ten-Year Report contains two sets of tables of monthly data:

1. Estimated harvest, selected species; and other harvested species reported; and 2. Hunter response, and number of hunters harvesting selected species.

In each case, data are provided by community [and for the Inuvialuit Settlement Region (ISR) as a whole], by month and year, and for the ten-year period as a whole. This report also describes the IHS mapping procedure, but does not include location data.

While annual reports were issued during the ten-year period, this volume provides additional information, not previously reported, on hunter response rates and complete information on estimated harvest rates using a consistent algorithm.

The 1998 and 2000 data are not included in this report. The IHS was suspended in 1999 and again in 2001 for an undetermined period.

### 1.3 Acknowledgements

The success of the Inuvialuit Harvest Study truly reflects the spirit of cooperative management envisioned by the architects of the Inuvialuit Final Agreement (IFA). The IHS design, implementation, and on-going activities have involved the Inuvialuit harvesters, the Hunters and Trappers Committees (HTCs), the Inuvialuit Game Council (IGC), the five IFA co-management bodies, and the sponsoring participant government agencies.

The contribution of the following people from 1986 to the present is gratefully acknowledged:

The IHS coordinator for many years, Michael Fabijan, as well as Sheila Nasogaluak and Mae Cockney for shorter periods of time. The IHS program manager in its latter years was Catherine Pinard.

There were many who contributed to the design, management, and execution of the IHS. These include, but are not limited to the following:

Alex Aviugana, Andy Carpenter Sr., Larry Carpenter, Billy Day, Bob Delury, Herbert
Felix, Nelson Green, Donald Inuktalik, and Eli Nasogaluak (IGC \& HTCs).
Sam Barry, Arne Goodman, Jim Hawkins, Jim Hines, and Kevin McCormick (Canadian Wildlife Service [CWS]).
Ron Allen, Vic Gilman, Lois Harwood, Pierre Lemieux, Dave Moshenko and Gerald Yaremchuk (Fisheries and Oceans Canada [DFO]).
Roger Binne, Susan Bonnyman, Randal Glaholt, Dyan Grant-Francis, John Nagy and Gord Stenhouse (Department of Resources, Wildlife, and Economic Development (NWT) [DRWED]).
Dorothy Cooley, Harvey Jessup and Brian Pelchat (Department of Renewable Resources (Yukon) [YTG-DRR]).
John Bailey, Dr. Tom Beck, Bob Bell, Ewan Cotterell, Robert Hornal, Bill Mair, Lindsay Staples and Dr. Peter Usher (IFA co-management bodies).
Dr. Norm Snow and Peggy Madore (project administration) and Robert Inglangasuk (data entry).

Pivotal to the implementation and output of the IHS, was the role of the field workers who conducted the door-to-door survey. Their dedication and diligence is acknowledged:

Foster Allen, Billy Archie, Dean Arey, Renie Arey, Nellie Elanik, Bessie Erigaktuk, Dodie Malegana, Don Storr, Denise Jerome and Sally Elanik (Aklavik).
David Kuptana (Holman).
Victor Allen, Linley Day, Noel Dick, Alex Kaglik, Ann Kasook, Lawrence Rogers, John
Rogers, Troy Smith, Tommy Thrasher, Ray Tingmiak and Velma Dick (Inuvik).
Lilly-Ann Green, Noel Green and Brian Kudlak (Paulatuk).
Earl Esau and Samantha Lucas (Sachs Harbour).
Janet Elias, Laura Ettagiak, Charles Gruben, Bessie Hagen, Marjorie Ovayak, Fred Wolki, Sandra Pascal and Kara Dillon (Tuktoyaktuk).

Amongst the field workers special mention should be made of David Kuptana who has been with the IHS for its duration. David's previous experience with the Kitikmeot Harvest Study was a great asset to the IHS and was particularly helpful in the training of new field workers.

Special thanks are also due to the more than twelve hundred individual harvesters who willingly allowed themselves to be interviewed regularly over the duration of the IHS, which could not have been conducted without their participation.

Dr. Peter Usher and Michael Fabijan prepared the initial text of this report which outlines the history and methodology of the IHS. Significant analytical input was provided by Abdellatif Dannati, Frances Laffey and Owen Powers (Statistical Consultation Group, Statistics Canada). Their efforts are greatly appreciated.

## 2. PROJECT HISTORY

### 2.1 Rationale and objectives of the IHS

The IFA of 1984 established a co-management system for wildlife and environmental management, and provided for harvester compensation in the event of adverse effects of development activities. The co-management bodies ${ }^{1}$ require harvest information [IFA 14(60)(h) and $14(78)$ ] and harvest data. The wildlife and fisheries bodies need this information to determine and recommend subsistence quotas, and in general for the rational management of renewable resources. The screening and review bodies need this information to fulfill their role in dealing with development. The IFA provides harvesters a role in gathering this information [14(64)(h), 14(76)(h), 14(78)]. The need for harvest data for compensation purposes is indicated in the requirements for proof of loss or damage [13(2), 13(8)] and for remedies [13(11), 13(18)(b)].

While the IFA does not specifically call for a harvest survey, the parties agreed in 1986 to establish a continuing harvest survey as the best method of obtaining the harvest information required. The survey was designed on the same basic principles as those conducted under the provisions of (or in anticipation of) other land claims agreements (JBNQ 1982, 1988, Jingfors 1986, Usher et al. 1985, Usher and Wenzel 1987, Gamble 1988).

The objective of the IHS, as stated in the original terms of reference, was to "obtain a continuous, long-term record of Inuvialuit harvest levels for each of the six communities," and to record these data by month and location. The IGC designated the IHS as the first priority among wildlife studies for funding from IFA implementation moneys.

The initial phase of the IHS occurred in 1987, with the objective of conducting a oneyear recall study. The immediate need was to obtain data for a compensation agreement with a developer, in accordance with section 13 of the IFA. The monthly surveys began in November of that year, with the first ones backdating monthly data to July of 1987. The main phase of the IHS began in 1988, and is the subject of this report.

### 2.2 Funding and administration

The IHS was funded as a "wildlife study" under the terms of IFA implementation agreements between the Inuvialuit and Canada. The sponsoring agencies (DRWED, CWS, DFO, and beginning in 1994, DRR) have together allocated, from their portion of implementation funds, about \$250,000 annually over the period of review. The funds were administered by the Joint Secretariat (JS) - Inuvialuit Renewable Resource Committees, in Inuvik. The study operation was housed in the JS office.

### 2.3 Study organization and personnel

### 2.3.1 Management

An Inuvialuit Harvest Study Working Group (IHSWG) was established in 1986 as the project steering committee. Membership consisted of representatives from the IGC, FJMC, DRWED (formerly NWT Department of Renewable Resources), DFO, CWS, Department of Indian Affairs and Northern Development (DIAND), the JS, and (later) DRR (Yukon). The group thus represented the harvesters, the funding agencies, and the main potential users of harvest data. The IHSWG met on a regular basis during the first year (1986-1987), chiefly in Yellowknife where many members were located, to address funding, staffing, administration, objectives, and technical design. This first IHSWG was dissolved in 1987 and a second IHSWG was established in Inuvik (with similar representation) in order to monitor, support, and provide direction to the study on a continuing and more informal basis. Its terms of reference are provided in Appendix 1.

[^0]In June 1996, responsibilities of the IHSWG were taken over by the Inuvialuit Harvest Study Evaluation Committee. This group was established to oversee the evaluation of the study methodology and make recommendations for changes for a future program. Following the evaluation, the Inuvialuit Harvest Study Management Committee (IHSMC) was established to administer and redesign the IHS according to the recommendations adopted from the evaluation. Membership consisted of three persons appointed by the IGC, and the chairs of the three wildlife and fisheries co-management bodies [WMAC(NWT), WMAC(NS), and FJMC].

### 2.3.2 Study coordinator

The position of IHS coordinator was staffed by the JS in April 1987. Initial training and technical support were provided by DRWED's regional biologist, in Inuvik.

Duties of the IHS coordinator included coordination of all aspects of the study; management of the budget; designing and implementing methods of data collection; designing and producing the IHS calendar; conducting community and hunter consultations; hiring, training and managing local fisheries and wildlife resource persons (field workers); designing and implementing a computer data base management system; entering, verifying, and analysing the data; preparing reports; acting as liaison between the hunters, Inuvialuit organizations, sponsoring agencies, and other interest groups; and disseminating harvest data.

When the study evaluation process began in 1996, the IHS coordinator partially redesigned the IHS to operate on a "low maintenance mode." After April 1996, the HTCs were responsible for ensuring that data were collected on a monthly basis; that hunter interview records were updated each month; and that the raw data were sent to the JS. The IHS coordinator assisted the HTCs in starting this process and in June 1996 provided each HTC with an instruction manual, and the JS with instructions for data entry and verification. The IHS coordinator position was terminated in July 1996 and data processing was done on a contract basis thereafter.

### 2.3.3 Field workers

During the first phase (1987), one field worker was contracted in each community to assist the IHS coordinator for a period of three to five days. These persons were appointed by the local HTC directors. During this first phase, the field workers were responsible for selecting the hunters to be interviewed, communicating the study rationale and objectives and introducing the study coordinator to the hunters, and assisting in hunter recall interviews.

Implementation of the main phase of the IHS began in the fall of 1987. Field worker positions were advertised in each community with applications submitted to either the IHS coordinator or the local HTC. Applicants were interviewed by the HTC directors, the IHS coordinator, and a member of the IHSWG. Selection of the field workers was made by the HTC directors, with input from the IHS coordinator and the IHSWG member. All of those hired for the first phase successfully applied for the permanent positions filled in October and November 1987, and an additional field worker was hired for Inuvik. Since then, the number of field worker positions has varied between one and two in Inuvik and Tuktoyaktuk, and up to three in Aklavik. Paulatuk, Holman, and Sachs Harbour were assigned one position each.

Field worker training was conducted by the IHS coordinator during a two-day workshop in Inuvik, during November 1987. Once field workers returned to their community and began working, communication was maintained by phone. Throughout 1988 the IHS coordinator worked closely with the field workers and assisted in hunter interviews

INUVIALUIT HARVEST STUDY Data and Methods Report 1988-1997

during community visits. When new field workers were hired, the IHS coordinator trained and accompanied them on their first round of interviews.

Field workers were required to determine and maintain a current list of local hunters; distribute the IHS calendar; interview hunters on a monthly basis to collect harvest data for the previous month(s) and record this information on data sheets; ensure accuracy of data collected; and provide information as required to the IHS coordinator, IGC, and the local HTC. It was also intended that the field workers assist in local fish and wildlife research programs.

Field workers were hired under contractual agreement, and received a standard monthly payment. The objective of this arrangement was to attract conscientious individuals who would be committed to long-term involvement with the study, and thus minimize interruptions in data collection, potential data losses, and costs associated with rehiring and training. It was also intended that field workers establish and maintain a positive relationship with the hunters, identify trends in the harvest, and monitor hunter activity. Of approximately 30 field workers hired during the ten-year period for the six communities, 14 held their position for at least two years, and one field worker conducted the survey in his community for the entire period.

### 2.4 Community consultations

The IHS coordinator and a representative of the IHSWG conducted the initial community consultations at HTC and IGC meetings during May and June 1987, and provided information on the rationale, objectives, and design of the study, and on data confidentiality policy. The IHS coordinator solicited input to the study design both during these consultations and from individual hunters during the initial recall interviews conducted in June and July 1987. The final study design was presented to the HTCs by the IHS coordinator during the fall of 1987, and to individual hunters by the field workers during the initial round of monthly interviews. The proposed study design was accepted by the hunters and trappers, who thus provided their informed consent to participate in the survey. Holman had already participated in DRWED's Kitikmeot Harvest Study, and opted to participate in the IHS instead.

During 1988 the IHS coordinator attended IGC meetings and several HTC meetings in each community to update hunters on the progress of the study. Community consultations were also undertaken with the HTCs when a new field worker was hired. As part of the consultation process, field workers provided the HTCs with monthly data summaries. The status of the IHS, including current harvest data summaries for all communities, was reported to the IGC at every meeting.

As this study was initiated pursuant to the IFA, it was believed that the hunters would see the benefits of providing harvest information for both wildlife management and for the potential of future wildlife compensation resulting from development activities. It was assumed that hunter incentives to under-report with respect to possible management restrictions, and over-report for the purpose of possible compensation, would be balanced, and that strategic response bias would thus be minimized. Other sources of bias are discussed in sections 3.3, 3.7, 4.2, 4.3.2. In practice, those responsible for the survey considered that the reliability and specificity of recall increased as hunters got used to the survey.

### 2.5 Privacy and access policies

Individual harvest information is confidential. Hunters were identified in the database only by a unique hunter identification number. The hunter list with corresponding ID numbers is confidential, accessible only to the IHS coordinator, the local field worker and their local HTC. Hunters were guaranteed at the outset that individual data would

not be available to wildlife and fisheries agencies and therefore could not be used for law enforcement.

Individual hunters may obtain access to their own records for the purpose of damage or compensation claims and may authorize the release of their own personal information to third parties. No Inuvialuit organizations, except the HTCs, have access to the personal records of their members.

Draft survey results were reviewed and approved by the HTCs and the IGC. The purpose of review and approval by the HTCs was to record their approval of (or concerns with) the conduct of the survey during the year, and the apparent reasonableness of the community totals in light of the members' general knowledge of that year's harvesting patterns. This did not include any assessment of individual harvest data. The draft annual report was also reviewed by the IHSWG/IHSMC, and the IGC. Following approval by all parties, the data was considered final, and annual reports became available for public release.

Prior to final approval, summary data could have been made available to sponsoring agencies and comanagement bodies on an interim basis, with the understanding that these data were in draft status and were subject to revision. Until 1996, interim requests by these agencies for custom tabulations were met by the IHS coordinator. Subsequently, access protocols were developed by which the IGC would authorize the release of record level data (in the form of monthly harvest event information stripped of hunter ID numbers) in electronic format, to the sponsoring agencies for their own prescribed use, subject to confidentiality provisions. The master files containing the entire data set are under the sole control of the IHS and are not available to any other party.

Certain information not published in this report (see 4.2) exists in electronic format and is available for public access upon application to the IHS. Public requests for custom tabulations, including harvest locations, are subject to review by the IHSMC based on current privacy and access policies, the approval of the IGC, and available staff time.

### 2.6 Survey products

The primary survey product is the published annual data report. The IHS also produced monthly data reports for the HTCs, IGC, and all participating harvesters.

The IHS conducted or commissioned three evaluations and assessments of its operations and output (Fabijan et al. 1995, Usher et al. 1996, Usher and Wendt 1999).

INUVIALUIT HARVEST STUDY
Data and Methods Report 1988-1997
3.1 Study area

The study area includes the Inuvialuit Settlement Region (Figure 1) as described in the IFA. There are six communities in this area: Aklavik, Holman, Inuvik, Paulatuk, Sachs Harbour, and Tuktoyaktuk.

### 3.2 Definition of harvest

Harvest was defined as the number of animals killed and recovered. It did not represent or take into account wounding losses. Although rates of wounding or other non-retrieval were considered important information for management purposes, it was agreed that asking about wounding loss was overly intrusive, would unduly complicate and lengthen the interview, and take away from the primary purpose of the study, especially at the outset when it was important to obtain the cooperation of the hunters. Subsequently, the FJMC added such a component to its beluga monitoring program. The CWS recently conducted a study to determine struck and loss rates for Eider Ducks during the spring harvest at Holman (Byers and Dickson, 2001). To date these are the only species for which wounding loss studies have been undertaken, and they were done separately from the IHS.

Hunters were asked to report the total number of animals of each species that they harvested for subsistence use or commercial sale. Subsistence use was defined in the IFA as "the taking of wildlife by Inuvialuit for their personal use for food and clothing and includes the taking of wildlife for the purpose of trade, barter and sale among Inuvialuit and trade, barter and sale to any person of the non-edible by-products of wildlife that are incidental to the taking of wildlife for their personal use." (IFA, section 2).

Hunters were also asked to record their fur catches (including pelts sold and those retained for domestic use), any small-scale commercial harvests of fish and caribou and, if they guided sport hunters, any animals taken by those hunters while under their guidance. Field workers were instructed to ensure that all kills were attributed to specific individual harvesters to avoid double-counting where several harvesters hunted together and shared the catch. In some cases, harvests were recorded as evenly divided among a party even if this resulted in fractional values. However the sum of the harvest of a particular species in a particular reporting period was always a whole number.

The IHS was not intended to collect information on large-scale commercial harvests undertaken by Inuvialuit organizations, where the kill or catch was not necessarily attributable to single individuals, and for which, in many cases, there was another recording system. Over the course of the study these included the commercial harvest of muskoxen on Banks and Victoria Islands, the large-scale caribou harvest near Inuvik, and the commercial harvest of Arctic Char on Victoria Island and Broad Whitefish near Inuvik. Nonetheless, such catches were sometimes reported as such to the IHS. Similarly some data on Caribou taken under research permits were included in the IHS data base. These harvests were recorded as group catches under separate identification, and tabulated separately (Appendix 2). However, hunters were not asked specifically to report the disposition of their harvest, i.e. whether it was intended for personal or family consumption, gifts or barter within the community, or commercial sale.

### 3.3 Definition and identification of hunters

Harvesters (hunters) were initially defined as Inuvialuit male persons sixteen years of age and over, residing in the ISR. Exceptions were made for female heads of households who hunted, or women or younger children who specifically requested to report to the survey individually. Otherwise, the male head of household was asked to

figure 1

report the harvests of everyone in the household with his own, except for males sixteen and over living in that household who were asked to report separately.

At the request of the HTCs and the IGC, the Gwich'in population within the ISR was also included, in order to obtain a more complete record of harvest levels for the purposes of wildlife management. Subsequent to the implementation of the Gwich'in land claim settlement and harvest study, Gwich'in harvesters were removed from the IHS, and no Gwich'in harvest is included in this report. (see Appendix 3)

The hunter lists constituted the hunter population or sampling frame for the survey. These lists were initially compiled by the survey in cooperation with each community, using General Hunting Licence records and HTC membership lists, supplemented by local knowledge. At the time the study began, Inuvialuit beneficiary lists were unavailable to the IHS. Maintenance and revision of the hunter lists was the responsibility of the field workers, who were instructed to add individuals who moved into the community or became of hunting age, and to delete individuals who moved away or otherwise became ineligible for the survey. Each hunter on the list was assigned a unique and permanent identification number by the IHS coordinator. Hunters reported their harvests in their community of residence, even if they had harvested in the vicinity of another community in any particular month.

Normally, changes were made as required every month, with the result that the actual hunter population could change with each survey wave, although only by a small amount. In some instances, however, the field workers made major revisions of the hunter lists, and it is possible that in doing so, harvester eligibility criteria were not always consistently applied over time and between communities. Major revisions of the hunter lists were undertaken at Holman, Paulatuk, and Sachs Harbour in 1991, at Aklavik in 1994, and at Inuvik and Tuktoyaktuk in 1995. These resulted in significant increases to include more persons who did not normally harvest, or harvest very much. Data users are therefore cautioned that under-coverage may have occurred in the years prior to those increases.

### 3.4 Survey response

Census coverage attempted to ensure as complete reporting as possible of all harvesting activity. Monthly response of each individual on the hunter list was recorded on the data collection form (Appendix 4) as follows:

| Code 1-hunted | Code 6-could not contact |
| :--- | :--- |
| Code 2-hunted-no catch | Code 7-did not want to be interviewed |
| Code 3 - did not hunt | Code 8-moved |
| Code 4-out hunting | Code 9 -other (includes deceased) |
| Code 5-out of town |  |

Some of these categories were collapsed in the published tables in this report (see 4.3.1).

### 3.5 Species list

The initial species list was developed during discussions with the IHSWG and the communities. Considerations included the significance of species for wildlife and fisheries management purposes, and harvester identification capability especially for incidental fish and bird species. Neither plants nor marine invertebrates were included.

INUVIALUIT HARVEST STUDY
Data and Methods Report 1988-1997

Harvested animals were normally identified by species. However, in some cases species were grouped (especially where more specific identification was not reliable), or were segregated according to physical morphology or colour phase of the animal. In a few cases, especially in the early years of the survey, some harvests were reported at the level of family rather than species (e.g. fish, seals, geese). The complete species list is provided in Appendix 5.

Sex and maturity of the animals were requested initially for large mammals. Subsequently this information was reported for some other species. Hunters were asked to report whether the animal was an adult, a juvenile (over one year of age but not yet mature), or young of the year. No formal criteria was provided by the IHS and this identification was based on common harvester knowledge (e.g. based on size of animal, pelage, horn or antler development, or presence in family group).

During the course of the IHS , occasional reports of other species were received. All such data were recorded, and some were added to the species list. Species that were recorded only occasionally are listed in Appendix 6. The species list was used as an interview guide for field workers, but was not read out to respondents.

### 3.6 Data collection materials

At the beginning of each monthly interview cycle, the IHS coordinator provided each field worker with an updated interview record book (including revised hunter list based on information provided by the field worker the previous month) indicating what information was required from each hunter for which month, and the map set from which the previous month's data had been extracted by the IHS coordinator.

The field workers updated their interview record books after each interview to show what data had actually been collected from each hunter that month. At the conclusion of each interview cycle, completed data forms were sorted by hunter number, placed in a ring binder, and returned to the IHS coordinator along with the maps.

### 3.6.1 IHS calendar

The IHS calendar was intended as a tool to increase the quality of harvest information and elevate the profile of the harvest study. It was designed to provide individual hunters with a method of recording their harvest on a daily basis, and to provide visual identification of fish and wildlife species of concern to the study. Calendars were distributed annually to the hunters in the course of their regular interviews (calendars were also used as promotional items for the study).

Although there is no record or evaluation of actual calendar usage as a record keeping tool, the calendar was generally well received. Hunters liked the calendar and expected to receive it each year. Anecdotal reports indicate that most field camps had a copy prominently displayed in their tents or cabins. Even if the calendar was not always used as a recording tool, it appeared to serve as a useful reminder of the study and of the monthly interviews. Sometimes field workers were able to record harvest information directly from the calendar. The detail of some harvest information, particularly during the busy spring months, strongly suggests that daily harvest records were kept in some cases.

### 3.6.2 Data collection forms

The data collection form used to record individual hunter harvest information remained essentially the same since 1988 (Appendix 4). Individual harvesters were only identified on the data form by a unique hunter number recorded in the field worker's list. The top part of the form recorded the hunter number, the name of the community, the interview date, the month(s) for which the current information applied, and the hunting code (see 3.4).

The main part of the form recorded the species name, number harvested, sex and maturity of animals where known, harvest location (by name and map area), and date of harvest. The harvest location was recorded by name and number on the data form under "location name" and "map area," respectively. The map area number referred to a location drawn and numbered on the topographic maps. The date of harvest was reported as a specific kill date or range of kill dates, within the month. Observations or explanatory notes by either the hunter or field worker were recorded in the comments section.

### 3.6.3 Maps

The geographic location of each harvest event was marked on topographic maps. Maps also functioned as a recall aid by encouraging harvesters to retrace their activities on the land. The map scale and topographic map format used for the harvester interviews was designed to facilitate the needs of the hunter, field worker, data collection, data entry into the database, and protection of the maps for extended use. Each field worker had a set of topographic maps that covered the entire ISR, as harvesters were known to hunt outside the areas commonly used by hunters from a particular community.

Initial consultations with the HTCs and the hunters indicated that topographic maps at a scale of 1:250,000 would satisfy their needs and that hunters could locate and mark their harvest locations on them. The study's sponsoring agencies agreed that this level of precision would also satisfy their needs with respect to wildlife management. 1:50,000 scale maps were also used in Aklavik from January 1990 to January 1993 and in Paulatuk from January 1991 to December 1994, at the request of the field workers and some hunters who found it difficult to locate their harvesting areas at the smaller scale, especially in the Mackenzie Delta with its myriad lakes and channels. The resulting map set was, however, cumbersome and time-consuming to use, and was discontinued.

Individual topographic maps were taped together to show a larger area. Specific combinations of map sheets were used to create appropriate "map pages" for each community, showing the areas most commonly used by local hunters, and retaining the relevant UTM zone designation and grid coordinates at the outside edge. This format allowed the hunter to view a large area at once, and eliminated the problem of marking use that overlaps several individual sheets.

Harvest locations were marked on the maps by either the harvester or the field worker. These locations could be recorded as specific locations (points), general areas (polygons), or (in the case of traplines) lines.

### 3.7 Data collection methods

A monthly cycle of interviews was adopted on the grounds that it would provide an accurate record of harvest, minimize recall error, and not impose an undue burden on hunters. This report covers ten years or 120 successive monthly interview waves. Each interview wave was treated independently, as both the population size and the response rate varied. In practice, however, hunters not contacted by the field worker in any particular month were asked to fill in previous months' harvest when finally contacted. Thus, an initial survey record of non-response could have been revised if a response was obtained in a later month. This "backfill" procedure could have occured for any month up until March of the following calendar year, when the previous year's survey record was formally closed. Recall for earlier months within that time frame is considered sufficiently accurate to justify this procedure, especially in view of the use of recording aids (see 3.6.1).
3. Methods

The IHS was conducted as a door-to-door survey, requiring a personal interview of the harvester by the field worker every month. Hunters were interviewed using an open ended informal approach. Interviews typically lasted 15-20 minutes, at most 45 minutes for months of peak harvesting activity.

At the conclusion of each interview, the hunter was thanked for his or her participation and given a copy of the information just provided. Respondents were also asked to sign the field worker interview book as proof that they had been interviewed (since 1989), both for the integrity of the survey and for protection of the field worker. During the interview hunters were also given a summary sheet containing information on the community's monthly and annual to-date harvest levels for the current calendar year. In 1989 the summary sheet was expanded to include monthly and annual reported harvest levels for the previous calendar year.
4.1 The tables

The tables in this report were calculated by the Statistical Consulting Group, Statistics Canada, under contract with the JS.

This report contains seven sections of tables (one for each community and one for the ISR as a whole). Within each section, there are two sets of tables:

- Estimated harvest, selected species; and other harvested species reported; and
- Hunter response; and number of hunters harvesting selected species.
for each year, and a ten-year summary.

### 4.2 Estimated harvest

Total monthly harvests are estimated from reported harvests, using a projection formula based on the hunter response rate. It is assumed that there is no difference between respondents and non-respondents, and the former are therefore treated as a simple random sample of the hunter population.

Therefore the total harvest for month $m$ in community $c$ is estimated by

$$
\hat{Y}_{m c}=\frac{N_{m c}}{n_{m c}} \sum_{i} y_{m c i}
$$

## where

$N_{m c}$ is the number of hunters in month $m$ and community $c$;
$n_{m c}$ is the number of hunters reporting in month $m$ and community $c$;
$y_{m c i}$ is the harvest reported by the reporting hunter $i$ in month $m$ and community $c$.
The variance for the estimated total is estimated by
where

$$
\hat{\operatorname{Var}}\left(\hat{Y}_{m c}\right)=\frac{N_{m c}^{2}}{n_{m c}}\left(1-f_{m c}\right) s_{m c}^{2}
$$

$f_{m c}=\frac{n_{m c}}{N_{m c}}$ is the sampling fraction in month $m$ and community $c$;

$$
s_{m c}^{2}=\sum_{i}\left(y_{m c i}-\bar{y}_{m c}\right)^{2} /\left(n_{m c}-1\right) \text { is the sample variance for month } m \text { and community } c .
$$

Since each month is treated as a separate survey, the annual total harvest for community $c$ is estimated as the sum of the monthly estimates,

$$
\hat{Y}_{c}=\sum_{m} \hat{Y}_{m c}
$$

and because the surveys are independent the variance is estimated as the sum of the estimated variances

$$
\begin{aligned}
\hat{\operatorname{Var}}\left(\hat{Y}_{c}\right) & =\sum_{m} \hat{\operatorname{Var}}\left(\hat{Y}_{m c}\right) \\
& =\sum_{m} \frac{N_{m c}^{2}}{n_{m c}}\left(1-f_{m c}\right) s_{m c}^{2}
\end{aligned}
$$

4. Inuvialuit Harvests 1988-1997

The assumption of no non-response bias is appropriate for the present purpose because even though there is some indication that it does not always hold, response rates are sufficiently high to minimize its possible effects. Because N refers to the hunter population as a whole, and not the number of hunters harvesting any particular species, harvest specialization (variation in hunter effort among target species) is not directly accounted for in the survey. The coefficients of variation (CVs) for some species are relatively high, but this may be in part due to the inability to identify species-specific harvester effort.

Total harvest is not estimated for:

- species recorded irregularly or in small numbers;
- species whose identification is uncertain; or
- mammals rarely harvested in the ISR
but these are reported in Appendix 6 or in Other Harvested Species tables.
Species of exceptional management concern (Grizzly Bear, Dall Sheep) are nonetheless included in these tables.

Community, commercial, and research harvests recorded by the IHS were subtracted from the reported totals prior to estimation. Those harvests are reported separately in Appendix 2. Data users may wish to add those values, as appropriate for their own purposes, to estimated harvest totals.

To maximize data utility, species data have been combined as follows:

- Arctic Char includes Arctic Char and Arctic Char (spawning);
- Caribou includes Caribou, Barren-ground Caribou, Bluenose Caribou, Peary Caribou, and Island Caribou;
- Arctic Fox includes White Fox and Blue Fox;
- Coloured Fox includes Red Fox, Cross Fox, Silver Fox, and Black Fox;
- Snow Goose includes Snow Goose and Blue Goose; and
- Eider includes Eider, Common Eider, and King Eider.

The tables showing monthly and annual harvest for each year indicate the margin of error for the annual harvest estimate at the $95 \%$ confidence interval.

The estimated harvest tables do not include information on sex and age-class of harvested animals. This information has been tabulated and may be obtained from the IHS as outlined in 2.5.

The reported harvest tables show the harvest of all other species as actually reported to the IHS from 1988 to 1997, except those in Appendix 6. These tables do not include HTC, commercial, and research harvests (see 3.2 and Appendix 2).

### 4.3 Hunter response and activity

These tables are in two parts. The first shows the details of hunter response, including response rate, by month and year. The second shows the number of hunters harvesting selected species, by month and year.

### 4.3.1 Hunter response

The original hunter response codes (see 3.4) were collapsed as part of the final data cleaning process for this report. All persons reporting code 1 in any month have a record of harvest for that month.

INUVIALUIT HARVEST STUDY
Data and Methods Report 1988-1997

| 4. Inuvialuit Harvests 1988-1997 | The final response categories identified in the tables are: |  |  |
| :---: | :---: | :---: | :---: |
|  | Categories in this report |  | Original survey codes |
|  | Harvested |  | 1 - hunted |
|  | Did not harvest |  | 2 - hunted - no catch 3 -did not hunt |
|  | Not interviewed |  | 4 - out hunting |
|  |  |  | 5 - out of town |
|  |  |  | 6 - could not contact |
|  |  |  | 7 - did not want to be interviewed |
|  | Out of scope |  | 8 - moved <br> 9 - other |
|  | Hunter list Codes 1 to 9 |  |  |
|  | Survey population Codes 1 to 7 |  |  |
|  | Hunters interviewed Codes 1 to 3 |  |  |
|  |  |  | Harvested <br> Code |
|  | Reponse rate: $\quad \sum_{1-3} / \sum_{1-7}$ |  |  |

Grizzly Bear

The annual values (right hand column) show the following:

| Hunter list <br> Survey population | number of persons on the hunter list in at least one month <br> number of persons in the hunter population in at least <br> one month |
| :--- | :--- |
| Hunters interviewed | number of persons interviewed in at least one month <br> number of persons harvesting in at least one month |
| Hespested | mean monthly response rate |

### 4.3.2 Non-response bias

Although response rates were generally high (over $87 \%$ for the ISR as a whole over the ten-year period), some non-response bias is likely to have occurred. The three chief sources of non-response bias can be identified but not precisely quantified. The first source is that some harvesters contacted declined to be interviewed. As is evident from the tables, the incidence of refusals is very small, however it is believed that in some instances, some of those persons were very active harvesters
("superhousehold")2 and hence atypical of the hunter population as a whole. Data users are cautioned that this may result in under-estimates of total harvest for some species, in some years, most notably for Tuktoyaktuk and Sachs Harbour.

The second possible source of non-response bias is incomplete coverage by field workers, whereby responses that should have been coded 4,5 , or 6 were reported as code 3. This is considered to have occurred only in the years of low-maintenance mode operation of the survey (1996 and 1997), mainly in Tuktoyaktuk and Inuvik. Both the Tuktoyaktuk and Inuvik HTCs issued formal cautions with respect to the 1997 data for

[^1]4. Inuvialuit Harvests 1988-1997

their communities. In the case of Tuktoyaktuk, it is thought that some particularly active harvesters were systematically missed, with the result that total harvests may be under-estimated for some species in those years. Missed coverage in Inuvik is not known to have introduced similar systematic bias.

A third source of error, consisting of survey avoidance by respondents reporting no harvest and thus terminating the interview, has been hypothesized but not documented (Usher and Wendt 1999:14). This strategic non-response, if it occurred, may have been a result of informant fatigue in the latter years of the survey. It is evident that the number of active hunters (those who reported harvesting anything in a year) declined in every community except Holman over the ten-year period, and as a proportion of the total hunter list, everywhere in the ISR. While this trend is thought likely to be real, some unknown proportion of it may be due to this postulated third source of error, and would therefore be merely an artifact of the survey.

These possible sources of error would likely result in under-counts in some cases. The degree cannot be estimated precisely but is not considered large.

### 4.3.3 Number of hunters harvesting selected species

The lower portion of each table shows the number of hunters harvesting each species in each month, and at any time during the year. Incidental species, and some species harvested in very small numbers have been omitted from this table. Where harvesting effort is not specifically targeted with respect to race, sub-species, or closely related species, species are combined (see section 4.2).

These tables do not include HTC, commercial, or research harvests itemized in Appendix 2.

## APPENDIX 1

Inuvialuit Harvest Study working group terms of reference

Inuvialuit harvest study objectives
The overall objective of the IHS is to obtain a continuous, long-term record of Inuvialuit harvest levels for each of the six communities in the ISR. The IHS will collect information about when, where, and how much fish and wildlife is harvested. This information is to be collected to address the needs of the Inuvialuit for use in management of renewable resources and determination of harvest loss compensation (IFA (14(78)), 1984).

In order to attain these objectives an IHSWG is hereby established. The responsibilities of the IHSWG shall include budget allocation decisions, coordination of funding between sponsoring agencies, technical advisory support, and monitoring implementation of the IHS .

## Membership

1) Membership on the IHSWG shall consist of one (1) member each from Government of Northwest Territories - Department of Renewable Resources, Fisheries and Oceans Canada, Canadian Wildlife Service, Inuvialuit Game Council, and the Joint Secretariat. Each participant may designate one alternate.
2) Additional members may be added at the discretion of the IHSWG.

## Operating procedures

3) The representative from the JS is to be the chairman.
4) Each member shall be allowed one (1) vote.
5) The chairman shall be entitled to a vote only in the event of a tie.
6) The IHSWG shall meet not less than once a year.
7) For normal business three (3) members shall constitute a quorum of the IHSWG.
8) Notwithstanding seven (7), no decision shall be made regarding issues which require the input from a particular agency, in the absence of representation by that agency.
9) The IHSWG shall have the ability to conduct its business by tele-conference.
10) Secretarial support shall be provided by the JS.

## Responsibilities

11) The IHSWG shall:
a) provide guidance and review to assist the IHS in achieving its objectives;
b) provide a forum to review and approve the use and dissemination
of information collected through the IHS;
c) provide the reporting mechanism to the funding agencies;
d) ensure coordination between the IHS and the other renewable resource committees established under the IFA;
e) review the draft annual report of the IHS and provide comment to the IHS field coordinator within thirty (30) days of receipt of that report; f) review and approve the annual proposal and budget;
g) approve the final version of the annual report prior to its release; and
h) review and provide comment on IHS peripherals eg. newsletter, calendar, data sheet format in a timely manner to the IHS field coordinator.

In addition to the above:
12) Data summaries will be made available to the IHSWG on a monthly basis.
13) The annual report shall be in calendar year format and will be completed by 31 March. A data summary will be made available in mid-January.

APPENDIX 2
Community, commercial, and research harvests reported to IHS

Five hunter numbers were assigned to group hunts rather than to individuals. Twenty records exist for these numbers, as follows:

| Harvest type | Community | Year | Number of records | Reported harvest |
| :---: | :---: | :---: | :---: | :---: |
| Research harvest | Sachs Harbour | 1993 | 6 | 7 Caribou |
|  |  | 1994 | 1 | 5 Caribou |
| Commercial harvest | Sachs Harbour | 1988 | 1 | 29 Muskox |
|  |  | 1991 | 5 | 308 Muskox |
| HTC harvest | Holman | 1994 | 1 | 700 Char |
|  |  | 1995 | 1 | 1100 Char |
|  |  | 1996 | 1 | 325 Char |
|  |  | 1997 | 1 | 63 Char |
|  |  | 1996 | 1 | 147 Muskox |
| HTC harvest | Sachs Harbour | 1989 | 1 | 87 Muskox |
|  |  | 1990 | 1 | 104 Muskox |

Research harvests - harvest authorized by Minister's permit for research purposes, meat provided to community.

Commercial harvests-partial reports of commercial harvests.
HTC harvests - Holman char intended for commercial sale within the ISR; muskox are probably partial reports of commercial harvests.

These records are excluded from the reported harvest data set for the purpose of estimated total harvests. Data users may add these values to estimated harvest totals, according to their own requirements.

IHS hunter record (data collection form)

## INUVIALUIT HARVEST STUDY HUNTER RECORD

## APPENDIX 5

Species list

| Common Name | Scientific Name | Local Name | Translated Name |
| :---: | :---: | :---: | :---: |
| Birds |  |  |  |
| Brant | Branta bernicla |  | Nigliknak, Negleknak |
| Canvasback | Aythya valisineria |  |  |
| Crane (Sandhill) | Grus canadensis |  | Tatidjgaq, Tatirgaq, Tatilgak |
| Eider (Common) | Sometaria mollissima |  | Quingalik, Amaolik, Amauligruaq |
| Eider (King) | Sometaria spectabilis |  | Quingalivik, Kingalik, Qinalik |
| Goldeneye (Barrow's) | Bucephala islandica | Duck (Bell) | Avilugtuq, Avilugtauruk |
| Goldeneye (Common) | Bucephala clangula | Duck (Bell) | Aviluqtuq, Avilugtauruk |
| Goose (Canada) | Branta canadensis |  | Ulugullik, Oloagotik |
| Goose (Greater White-fronted) | Anser albifrons | Yellow Legs | Niglik, Nirliq |
| Goose (Ross) | Chen rossii |  |  |
| Goose (Snow) | Chen caerulescens | Wavies, Goose (Blue) | Kanguq, Kanuq, Kangok |
| Loon (Common) | Gavia immer | Loon (King) | Tutik, Tuuliik |
| Loon (Pacific Arctic) | Gavia pacifica |  | Maliri |
| Loon (Yellow-billed) | Gavia adamsii |  | Qaqsauq, Qaqauq, Qaqruaq |
| Mallard | Anas platyrhynchos |  | Kurugakpak |
| Merganser (Common) | Mergus merganser | Duck (Pie) |  |
| Merganser (Red-breasted) | Mergus serrator | Duck (Pie) |  |
| Oldsquaw | Clangula hyemalis | Duck (Squaw) | Ahaliq, Ahangik |
| Owl (Snowy) | Nyctea scandiaca |  | Ukpik, Okpik |
| Pintail (Northern) | Anus acuta |  | Ivugaq, Kurugaq, Irugaq, Kurgaq |
| Ptarmigan (Rock) | Lagopus mutus | Ptarmigan | Aqidjigiq, Qargiq, Qariq, Nikhaktok, Akilgik |
| Ptarmigan (Willow) | Lagopus lagopus | Ptarmigan | Aqidjigiq, Qargiq, Qariq, Nikhaktok, Akilgik |
| Scaup (Greater) | Aythya marila |  | Kaklgutuuk, Qaqtuatug |
| Scaup (Lesser) | Aythya affinis |  | Kaklgutuuk, Qaqtuatug |
| Scoter (Black) | Melanitta nigra | Duck (Black) | Tuungavik, Taaktuaq |
| Scoter (Surf) | Melanitta perspicillata | Duck (Black) | Tuungavik, Taaktuaq |
| Scoter (White-winged) | Melanitta fusca | Duck (Black) | Tuungavik, Taaktuaq |
| Shoveler (Northern) | Anas clypeata | Spoon Bill |  |
| Swan (Trumpeter) | Cygnus buccinator |  | Qugruk, Kogyok |
| Swan (Tundra) | Cygnus columbianus |  | Qugruk, Kogyok |
| Teal (Green-winged) | Anas crecca |  |  |
| Wigeon (American) | Anus americana | Duck (Whistling) | Ugguigik, Ugiuhiuq |
| Fish |  |  |  |
| Burbot | Lota lota | Loche | Tiktaalik, Tittaliq |
| Char (Arctic Anadromous) | Salvelinus alpinus | Char, Char (Red) | Iqalukpik, Qalukpik, Evitaruk |
| Char (Arctic Land-locked) | Salvelinus alpinus | Char, Char (Red), Char (Landlocked) | Iqaluakpak, Qaluaqpaq, Ekalukpik |
| Char (Dolly Varden) | Salvenilus malma | Char, Char (Red) |  |
| Cisco (Arctic) | Coregonus autumnalis | Herring (Lake) | Qaaktak, Qanktaq, Qaluhaq, Amagiak, Anma |
| Cisco (Least) | Coregonus sardinella | Herring (Lake) | Oaaktak, Qanktaq, Qaluhaq, Amagiak, Anma |
| Cod (Arctic) | Boreogadus saida | Cod (Rock) | Uugavik |
| Cod (Saffron) | Eleginus gracilis | Cod (Tom) | Uuqaq |
| Flounder | Splatichtys spellatus |  |  |
| Grayling (Arctic) | Thymallus arcticus | Grayling | Sulukqauqaq, Hulukpaugaq |
| Herring (Lake) | Coregonus artedi |  |  |
| Herring (Pacific) | Clupea pallasi | Herring (Blue), Bluefish | Piqquaqtita, Qaaktaq, Qaantaq, Pikoaktik |
| Inconnu | Stenodus leucichthys | Coney | Siiraq, Higaq, Sigaq |
| Pike (Northern) | Esox lucius | Jack Fish, Pike | Siulik, Hiulik |
| Sculpin (Fourhorn) | Myoxocephalus quadricornis |  |  |
| Sucker (Longnose) | Catostomus catostomus | Sucker |  |
| Sucker (White) | Castostomus commersoni | Sucker |  |

## APPENDIX 5

## Species list (continued)

| Common Name | Scientific Name | Local Name | Translated Name |
| :---: | :---: | :---: | :---: |
| Fish continued |  |  |  |
| Trout (Lake) | Savelinus namaycush | Trout | Iqaluakpak, Ehohok |
| Whitefish (Broad) | Coregonus nasus | Whitefish | Anaakliq, Anaqklik, Angnaklin |
| Whitefish (Lake) | Coregonus clupeaformis | Humpback, Crooked Back | Pikuktuuq, Qalupiaq, Kapihilik |
| Big Game |  |  |  |
| Bear (American Black) | Ursus americanus | Bear (Black) | Iggarliq |
| Bear (Grizzly) | Ursus arctos | Bear (Brown) | Aklaq, Akhak |
| Bear (Polar) | Ursus maritimus |  | Nanuk, Nanok |
| Caribou | Rangifer tarandus | Caribou (Barren-ground), <br> Caribou (Bluenose), <br> Caribou (Peary), Caribou (Island) | Tuktu, Tuttu, Toktu |
| Moose | Alces alces |  | Tuktuvak, Tuttuvak |
| Muskox | Ovibos maschatus |  | Umingmuk |
| Sheep (Dall) | Ovis dalli |  | Imnaiq, Imnaia |
| Furbearers/Small Mammals |  |  |  |
| Beaver (American) | Castor canadensis |  | Kiagiaq, Kigiak |
| Ermine | Mustela erminea | Weasel | Tigiak, Itigiak |
| Fox (Arctic) | Alopex lagopus | Fox (White), Fox (Blue) | Oggarliq, Qiangaqtuluk, Tiriganniaq, Tigiganeak |
| Fox (Coloured) | Vulpes vulpes | Fox (Black), Fox (Cross), Fox (Red), Fox (Silver) | Kiasirutilik, Qiangaq, Aukpilaqtaq, <br> Marraq, Qigniqtaq |
| Hare (Arctic) | Lepus articus |  | Ukalik |
| Hare (Snowshoe) | Lepus americanus |  | Ukalik |
| Lynx | Lynx lynx |  | Niutuyik |
| Marten (American) | Martes americana |  | Kavisiak, Qavvia, Qavviatchiaq |
| Mink (American) | Mustela vison |  | Tigiakpak, Itigiaqpak |
| Muskrat | Ondatra zibethicus |  | Kivgaluk |
| Otter (River) | Lutra canadensis |  | Pamiuquuq |
| Squirrel (Arctic Ground) | Spermophilus parryi |  | Sik sik |
| Wolf | Canis lupus |  | Amaruq, Amaguq, Amogak |
| Wolverine | Gulo gulo |  | Quavvik, Kalvik |
| Marine Mammals |  |  |  |
| Whale (Beluga) | Delphinapterus leucas | Whale (White) | Qilalugaq, Kilalogak |
| Seal (Bearded) | Erignathus barbatus |  | Ugyuk, Ugruk, Ogyak |
| Seal (Ringed) | Phoca hispida |  | Natchiq, Natik |
| Walrus | Odobenus rosmarus |  | Aiviq |

Note: Char (Dolly Varden) was reported as Char (Arctic) in this study, although all harvest from Tuktoyaktuk, Inuvik and Aklavik should be Char (Dolly Varden).

Those species not included in the original species list (Appendix 5) may have been reported inconsistently and may not constitute a full record of the harvest of those species by hunters responding to the survey. Refer to Appendix 6.

APPENDIX 6
Other reported species list

| Name | Community |
| :--- | :--- |
| Crab | Sachs Harbour |
| Eel | Tuktoyaktuk |
| Lamprey (Arctic) | Paulatuk |
| Salmon (Chum) | Aklavik |
| Salmon (Coho) | Sachs Harbour |
| Salmon (King) | Aklavik |
| Salmon (Pink) | Sachs Harbour |
| Salmon (Sockeye) | Aklavik, Sachs Harbour, Tuktoyaktuk |
| Salmon (unspec.) | Aklavik |
| Shrimp | Sachs Harbout |
| Whale (Bowhead) | Aklavik |
|  |  |
| Duck eggs | Holman |
| Duck (Wood) | Inuvik |
| Grouse (unspec.) | Inuvik |
| Jay (Grey) | Tuktoyaktuk |
|  |  |
| Lemming | Holman |
| Mouse | Holman |
| Porcupine | Aklavik |
| Squirrel | Inuvik |

Other species reported in each community that were not included in the species list. This may not constitute a full record of the harvest of those species since they were reported inconsistently.

Aklavik Tables

Table 1 Total estimated harvest, selected species, monthly, Aklavik, 1988

| Category | Species | Jan | Feb | Mar | Apr | May | Jun | Jul | Aug | Sep | Oct | Nov | Dec | Total ${ }^{\ddagger}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$\Delta$ Mean monthly response rate.
$\ddagger \ddagger$ Some hunters may have hunted in more than one month but are only counted once in the total.
*** Data for Eider was collected and reported by species (Common and King) in Holman. Detailed information is available from the Joint Secretariat.

$\Delta$ Mean monthly response rate.
$\ddagger \ddagger$ Some hunters may have hunted in more than one month but are only counted once in the total.

$\Delta$ Mean monthly response rate.
$\ddagger \ddagger$ Some hunters may have hunted in more than one month but are only counted once in the total.

[^1]:    2 The term "super-household" was used by Wolfe (1987), in the context of subsistence harvesting, to denote harvesting specialization as observed by harvest surveys conducted by the Division of Subsistence of the Alaska Department of Fish and Game. It refers to the minority of highly productive households in each community that produce most of the community's wild food supply.
